Introduction

Mintec Systems is a software development company. With over 30 years experience and 25 staff, we bring a wealth of experience to bear on every engagement with our customers. Our customers all have Information Management issues. These issues can vary from just needing to retrieve data from one database, to the need to build a system to maintain a complex workflow.

Our experience covers many different technologies and industries. More importantly, our experience covers a wide range of different problems and the associated solutions.

Software Solutions

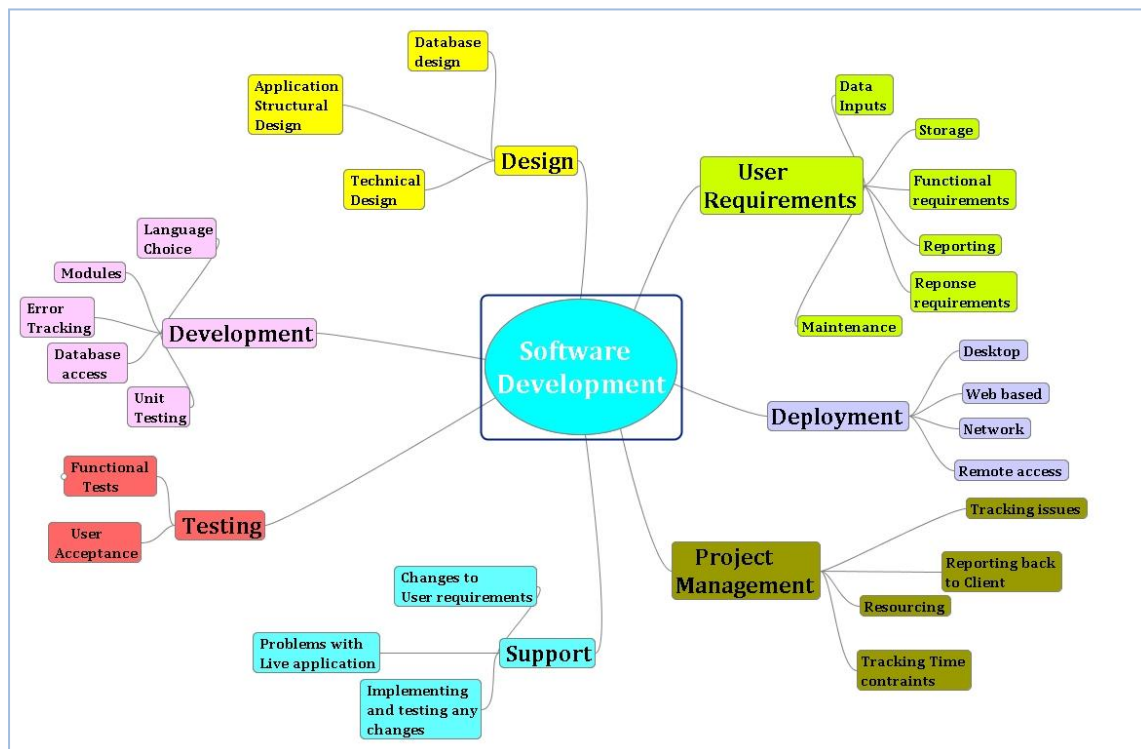

It starts with a problem. These problems can be very diverse in nature. As a result the best solution can be equally diverse. In today's business environment most clients have an existing system. The problem can often become:

- How to fit in well with the existing system
- How to migrate the data to a new system
- How to fit in well with existing workflows
- How to minimise retraining for staff

Each problem needs to be discussed openly with an open mind as to the best approach. Since Mintec does not have a package that is sold, we do not look to find issues that fit the package. Rather we try to find solutions that fit the issues.

Also because we have a diverse technology base, we do not try to get the client to accept the technology that we are familiar with. If there is a better technology available, we will explore with the client and work out a recommendation.

Sometimes this will mean that Microsoft is the best solution. Sometimes a derivation from an open-source package may suit best.

1 - Aspects of Software Development

Industries

Mintec has also worked in many, many different industries. These include:

- Finance
- Insurance
- Call centres
- Public Authorities
- Emergency Services
- Agriculture
- Transport
- Aviation
- Communications
- Manufacturing

Each of these industries have their own localised issues. Though they all have similarities. The importance of:

- Testing
- Data reliability
- Requirements gathering
- Project management
- Communication with the client

is shown again and again.

Technologies

Mintec has a high level of competency in a range of languages, databases and other technologies to help our clients choose the best solution. We will learn old or new languages where that is the best way forward. Often we have had a client with a package that no longer has support. We can learn the language and the package and provide suitable support from that point forward. Some of the languages/technologies that are currently available are:

- Dot Net (VB.Net, ASP.Net, C# .Net)
- Visual Basic
- SQL Server
- MySQL
- Oracle
- ADA
- C++
- JAVA

Importantly we are equally at home in both transaction based systems as real time systems. We are often required to interface to unusual pieces of equipment and/or services.

Our Aims, Our Results

In the end, Mintec is looking to develop strong solutions to challenging problems and to build lasting relationships with our customers. We have many clients who have stayed with us over 20+ years. This is not because we are the only people that can work in a particular area. It is because we:

- Communicate honestly with clients
- Charge a reasonable rate for work done
- Are competent at what we do
- have the skills to tackle many issues
- provide long-term support to the client.

Initial contact

Please feel free to contact us. We will not charge until there is quoted body of work to do. The first discussion should be with Mike Pratt to discuss the issues and a possible way forward.
